Vehicle Demand Planning and VIN Arrival Check: Solution Overview

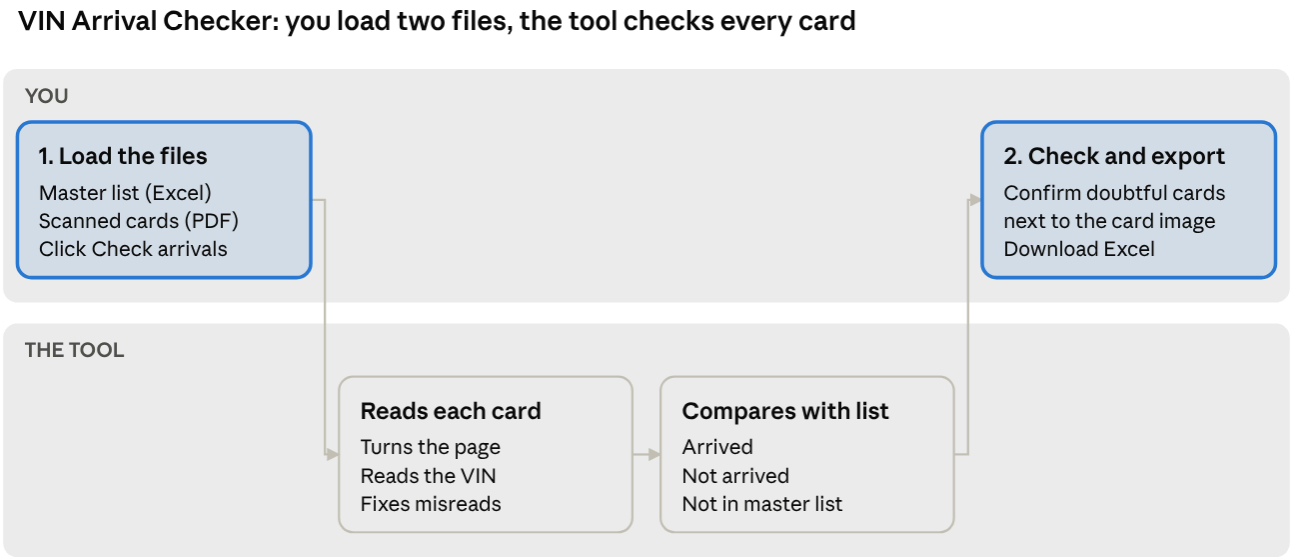

Oct 29, 2026 · @Mohammed jouhar

Two browser tools prepared for the brief: a Demand Planner that proposes the orders needed to reach the target stock cover, and a VIN Arrival Checker that compares scanned customs cards with the vehicle master list.

How it works

Demand Planner · 3 steps for you, 1 for the tool

VIN Arrival Checker · 2 steps for you, 2 for the tool

Both tools run in a web browser, and files stay on the user's computer.

Live demo with dummy data: mohammedjouhar.com/vehicle-tools

Results

Tool	Test	Result
Demand Planner	Dummy data: 2 car lines, 8 trims, 12 months	Closing stock, cover and proposed orders match the Excel model for every trim and month
VIN Arrival Checker	Dummy data: 31 pages	31 of 31 pages classified correctly
VIN Arrival Checker	Sample customs file: 14 pages, processed locally	12 of 13 cards matched in the second run; the one miss is now repaired. Final run: to be confirmed.

Suggested next steps

1. Try both tools in the demo with the demo files.
2. Share one model's planning sheet, figures removed, to match the template.
3. Run both tools beside the current manual process for one or two cycles.
4. Choose the daily setup: browser tool or server processing.
